Environmental Issues=

Essay on Environmental Issues: Environmental issues are a matter of concern these days. With the rise of pollution levels and depletion of the ozone layer, all the countries in the world are concerned about the environment. This is mainly because environmental degradation threatens the existence of humankind. Previously, no one even bothered to care about the environment. People were careless about their surroundings. But now, with rising awareness, some of them have become more cautious.

The most significant environmental issues of today are global warming and climate change. Very recently, the effect of climate change was discussed at the United Nations. Greta Thunberg, a Swedish climate activist, is currently working in the field of climate change. She is making people aware of its implications on human life. We have written two sample essays here on the topic for the benefit of students in their exams.

Environmental issues were not a matter of concern in the years gone by. People were not aware of the grave implications of environmental degradation. Lack of awareness leads to more damage to the environment. With the rise of the internet, everyone is aware of environmental issues today. Not all of them understand the deeper meaning of each one of those issues. However, given the state of the earth, people realize that all is not well.

There is a way in which every person cares for the environment. Some people respect it. Some try to nurture it. The crucial issues related to the situation today are mainly global warming, greenhouse effect, and climate change. Global warming is the increase in temperature of the earth due to the overconsumption of resources. It leads to other environmental issues like changes in temperature, soil erosion, and abnormal rainfall. Global warming can be tackled through control of pollution levels, lower vehicular emissions, and a person's carbon footprint.

The green-house effect is named after the greenhouse arrangement. Such an arrangement is usually made for the growth of plants. It consists of a non-permanent structure with sturdy enclosures. The green-house effect refers to the rise in carbon dioxide in the atmosphere. We all know that human beings take in oxygen and give out carbon dioxide. Similarly, plants take in carbon dioxide and give out oxygen. Rapid deforestation leads to a reduction in the number of trees and plants in the environment. Therefore there are very few plants to take in the carbon dioxide in the atmosphere. We must remember that humans are not the only source of carbon dioxide.

Carbon dioxide is released into the atmosphere through factories too. There are other reasons for the emission of carbon dioxide into the air. This carbon dioxide remains in the atmosphere if not taken in by the trees. Excess carbon dioxide can lead to breathing problems and other medical problems in the future. Greenhouse gases constitute not only carbon dioxide but other harmful gasses like sulfur dioxide and nitrogen dioxide. These

gases are released into the atmosphere through the various chemical plants. The best way to minimize the effect of green-house gases is afforestation programs.

Already a large number of afforestation programs have been taken up by the Governments of various countries. Social forestry programs and community forestry programs can also help in rapid afforestation. Also, to check the spread of harmful gases in the atmosphere, environmental laws can be made more potent and effective. Climate change is a relatively new environmental issue. There is already a large number of researches going on concerning climate change.

The definition of climate change makes it clear that climate change affects human lives slowly. This includes a change in climatic patterns and behavior that can affect the human settlement. Climate change is a problem that has both the elements of global warming and the greenhouse effect. It is expected to cause massive scale displacement in the coming years.

Environmental issues are not given much importance in most countries. A few exceptions are countries like Sweden, Denmark, and Finland, which gives equal importance to environmental problems. The present state of the earth requires each one of us to take the environment and issues related to it seriously. Most of us, however, do not do so. This is because the results of environmental damage are often not felt by us. These results are usually small in magnitude. An Environmental Essay is a commonly asked topic in most exams. It is meant to gauge the awareness of the candidates about the various environmental issues and their repercussions.

The effects of environmental degradation can be harmful and longstanding after a point of time. The negligence of the environment can be traced through our practices. Even with rising levels of pollution, erratic rainfall, and erosion of the topsoil, none of us are bothered. The efficacy of a country's environmental protection law reflects that country's attitude towards the environment.

For instance, in most African countries, laws related to the environment are feeble. In comparison to that in most Scandinavian countries have robust environmental laws. The major environmental issues of the world today are global warming, green-house effect, and climate change. The reasons behind the problems are mostly related to the grave amount of neglect and intolerance of humans towards the environment.

Environmental issues are a matter of concern these days. With rising awareness, some of them have become more cautious about the environment. Environmental issues were not a matter of concern in the years gone by.

People were not aware of the grave implications of environmental degradation.

The most significant environmental issues of today are global warming, climate change, and the greenhouse effect. Global warming leads to other environmental issues like changes in temperature, soil erosion, and abnormal rainfall. Global warming can be tackled through control of the pollution level. The best way to minimize the effect of green-house gases is afforestation programs. Climate change is a relatively new environmental issue. There is already a large number of researches going on with climate change.
